

Tutorial
F.E.M. 1.001 and Eurocode3 Fatigue

ANSYS[®]

22 Jan 2020
version 5.3

- ▶ This step-by-step tutorial demonstrates how to implement the fatigue check according F.E.M. 1.001 and Eurocode 3 in SDC Verifier.
- ▶ FEM 1.001 Fatigue and Eurocode 3 detailed review;
- ▶ Implementation in SDC Verifier;
- ▶ Weld Finder Tool overview;
- ▶ Fatigue tables and plots;
- ▶ Report preparation and results.

Allowable Stress Design method

The following formulae give for all values of κ the permissible stresses for fatigue

a) $\kappa \leq 0$

- for tension : $\sigma_t = 5 \cdot \sigma_w / (3 - 2 \cdot \kappa)$ (1)

- for compression : $\sigma_c = 2 \cdot \sigma_w / (1 - \kappa)$ (2)

σ_w is given in table above.

b) $\kappa > 0$

- for tension $\sigma_t = \sigma_0 / [1 - \kappa \cdot (1 - \sigma_0 / \sigma_{+1})]$ (3)

- for compression $\sigma_c = 1,2 \cdot \sigma_t$ (4)

where σ_0 = tensile stress for $\kappa = 0$ is given by the formula (1) that is :

$$\sigma_0 = 1,66 \cdot \sigma_w$$

σ_{+1} = tensile stress for $\kappa = +1$ that is the ultimate strength σ_R divided by the coefficient of safety 4/3 :

$$\sigma_{+1} = 0,75 \cdot \sigma_R$$

σ_t is limited in every case to $0,75 \cdot \sigma_R$.

By way of illustration, fig. A.3.6.1. shows curves giving the permissible stress as a function of the ratio κ for the following cases :

- steel A.52 ;
- predominant tensile stress ;
- group E6 ;
- construction cases W_0, W_1, W_2 for unwelded components and cases of construction for joints K_0 to K_4 .

The permissible stresses have been limited to 240 N/mm^2 , i.e. to the permissible stress adopted for checking for ultimate strength.

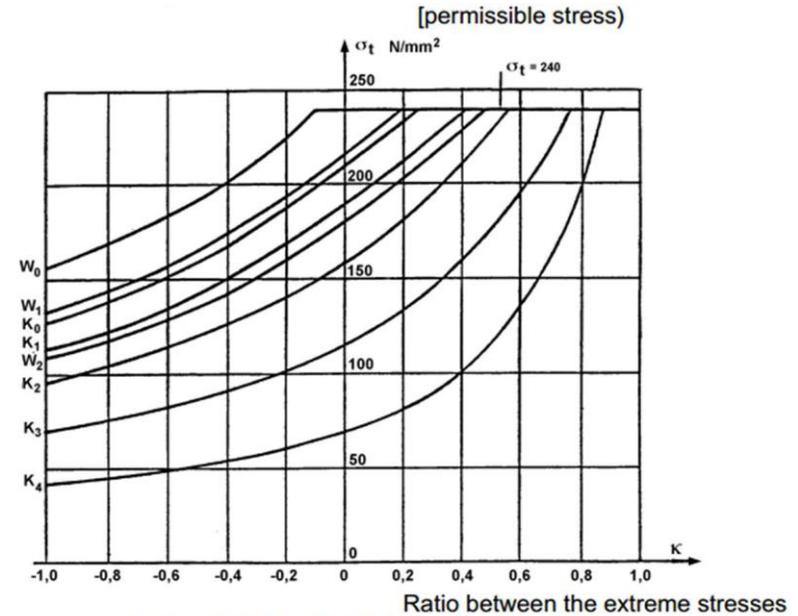

Figure A.3.6.1. - (A 52; tension; group E6)

Kappa Factor

$$K_x = \sigma_{x \min} / \sigma_{x \max}$$

$$K_y = \sigma_{y \min} / \sigma_{y \max}$$

$$K_{xy} = \tau_{xy \min} / \tau_{xy \max}$$

Allowable Stress

a) $\kappa \leq 0$

- for tension : $\sigma_t = 5 \cdot \sigma_w / (3 - 2 \cdot \kappa)$ (1)
- for compression : $\sigma_c = 2 \cdot \sigma_w / (1 - \kappa)$ (2)

σ_w is given in table above.

b) $\kappa > 0$

- for tension $\sigma_t = \sigma_0 / [1 - \kappa \cdot (1 - \sigma_0 / \sigma_{+1})]$
- for compression $\sigma_c = 1,2 \cdot \sigma_t$

Utilization Factor Combined

$$\left(\frac{\sigma_{x \max}}{\sigma_{xa}} \right)^2 + \left(\frac{\sigma_{y \max}}{\sigma_{ya}} \right)^2 - \frac{\sigma_{x \max} \cdot \sigma_{y \max}}{(|\sigma_{xa}| \cdot |\sigma_{ya}|)} + \left(\frac{\tau_{xy \max}}{\tau_{xya}} \right)^2 \leq 1$$

where the stress values σ_{xa} , σ_{ya} and τ_{xya} are those resulting from the application of formulae (1), (2), (3) and (4) limited to $0,75 \cdot \sigma_R$.

Stress Fatigue

Stress Fatigue is used in Fatigue Allowable Stress calculations.

Stress Fatigue depends on:

- Weld Type (W0-W2, K0-K4);
- Element Group / Loading Group (B1-B6);
- Material Type (St360/St37, St510/St52).

$$\kappa \leq 0$$

- for tension : $\sigma_t = 5 \cdot \sigma_w / (3 - 2 \cdot \kappa) \quad (1)$

- for compression : $\sigma_c = 2 \cdot \sigma_w / (1 - \kappa) \quad (2)$

Table T.A.3.6.1.

Weld Type

Weld Type – also called Notch Case, defines which elements belong to what weld type (K0-K4 – joints affected by welding, W0-W2 – elements and joints, not affected by welding). Weld Type depends on shape, structural design, whole pattern or type and quality of welds.

Case W₀

Reference	Description	Figure	Symbol
W ₀	Parent metal, homogeneous surface. Part without joints or breaks in continuity (solid bars) and without notch effects unless the latter can be calculated.		

Case K₀ - Slight stress concentration

Reference	Description	Figure	Symbol
0,1	Parts butt-welded (S.Q.) at right angles to direction of forces		

Case K₁ - Moderate stress concentration

Reference	Description	Figure	Symbol
1,1	Parts joined by butt welding (O.Q.) at right angles to the direction of the forces		

Case K₂ - Medium stress concentration

Reference	Description	Figure	Symbol
2,1	Parts of different thickness butt welded (O.Q.) at right angles to the direction of the forces. Asymmetrical slope : 1 in 3 (or symmetrical slopes : 1 in 2)		
2,4	Cruciform joint made with K-welds (S.Q.) perpendicular to the direction of the forces		

Case K₃ - Severe stress concentration

Reference	Description	Figure	Symbol
3,11	Butt weld with backing strip and no backing run. Backing strip secured by intermittent tack welds		
3,4	Cruciform joint made with K-weld (O.Q.) at right angles to the direction of the forces		

Case K₄ - Very severe stress concentration

Reference	Description	Figure	Symbol
4,1	Parts of different thickness butt welded (O.Q.) at right angles to the direction of the forces. Asymmetrical position without blend slope		
4,4	Cruciform joint made with fillet weld (O.Q.) at right angles to the direction of the forces		

Element Group also called Loading Group depends on: Class of Utilization, Load Spectrum.

Example of Load Cycles:

Load Cycles	Number	Total
Moves per hour	30	
Hours per day	10	300
Days per year	300	90000
Number of Years	20	1800000
Total	Million:	1.8

Class of Utilization **B7** (1.8 million < 2 x 10⁶)

Table T.2.1.4.2. - Classes of utilization

Symbol	Total duration of use (number n of stress cycles)		
B0	n	≤	16 000
B1	16 000	< n	≤ 32 000
B2	32 000	< n	≤ 63 000
B3	63 000	< n	≤ 125 000
B4	125 000	< n	≤ 250 000
B5	250 000	< n	≤ 500 000
B6	500 000	< n	≤ 1 000 000
B7	1 000 000	< n	≤ 2 000 000
B8	2 000 000	< n	≤ 4 000 000
B9	4 000 000	< n	≤ 8 000 000
B10	8 000 000	< n	

Load Spectrum

Table T.2.1.4.3. - Spectrum classes

Symbol	Spectrum factor k _{sp}	
P1	k _{sp}	≤ 0,125
P2	0,125 < k _{sp}	≤ 0,250
P3	0,250 < k _{sp}	≤ 0,500
P4	0,500 < k _{sp}	≤ 1,000

$$k_{sp} = (\sigma_1 / \sigma_{max})^c (n_1 / n) + (\sigma_2 / \sigma_{max})^c (n_2 / n) + \dots + (\sigma_r / \sigma_{max})^c (n_r / n) = \sum_{i=1}^r [(\sigma_i / \sigma_{max})^c (n_i / n)]$$

$$n_1 + n_2 + \dots + n_r = \sum_{i=1}^r n_i = n$$

Element Group

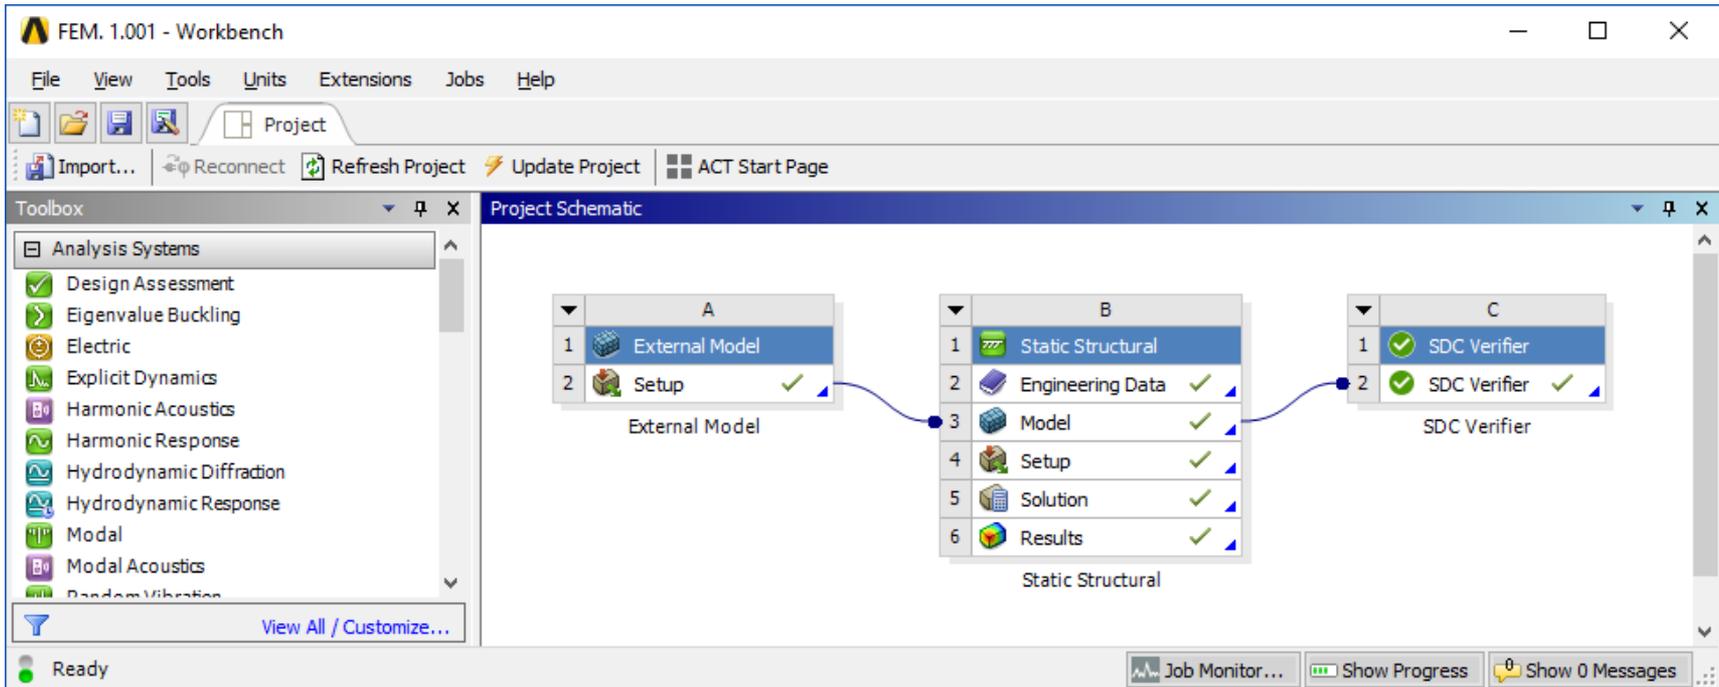

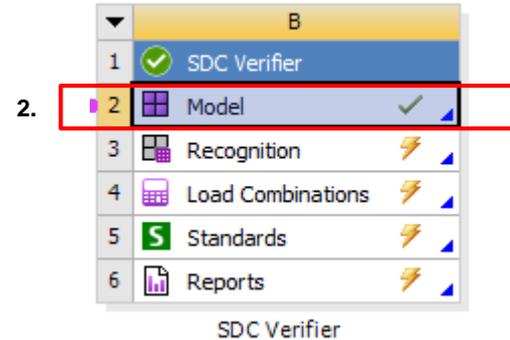

Table T.2.1.4.4. - Component groups

Plot of selected welds in colors and with labels of IDs

Weld Finder

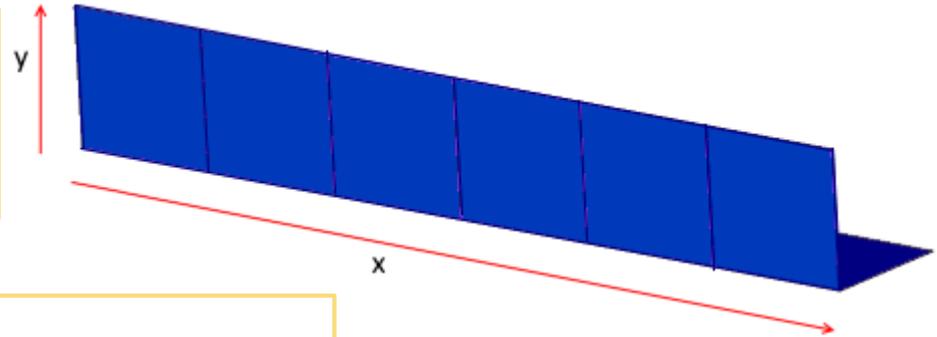

4 Click *As One Component*

5 Press *OK*.

Stress Transformation

Stresses for weld elements are automatically transformed in the direction of the corresponding weld from Weld Finder Tool using the wedge method. Stresses are transformed only for plate type elements.

$$\sigma_{nn} = \frac{(\sigma_{xx} + \sigma_{yy})}{2} + \frac{(\sigma_{xx} - \sigma_{yy})}{2} * \cos 2\theta + \tau_{xy} * \sin 2\theta$$

$$\tau_{nt} = -\frac{(\sigma_{xx} - \sigma_{yy})}{2} * \sin 2\theta + \tau_{xy} * \cos 2\theta$$

$$\sigma_{tt} = \frac{(\sigma_{xx} + \sigma_{yy})}{2} - \frac{(\sigma_{xx} - \sigma_{yy})}{2} * \cos 2\theta - \tau_{xy} * \sin 2\theta$$

$\sigma_{xx}, \sigma_{yy}, \tau_{xy}$ – original x, y and shear stress in local element x, y and shear directions

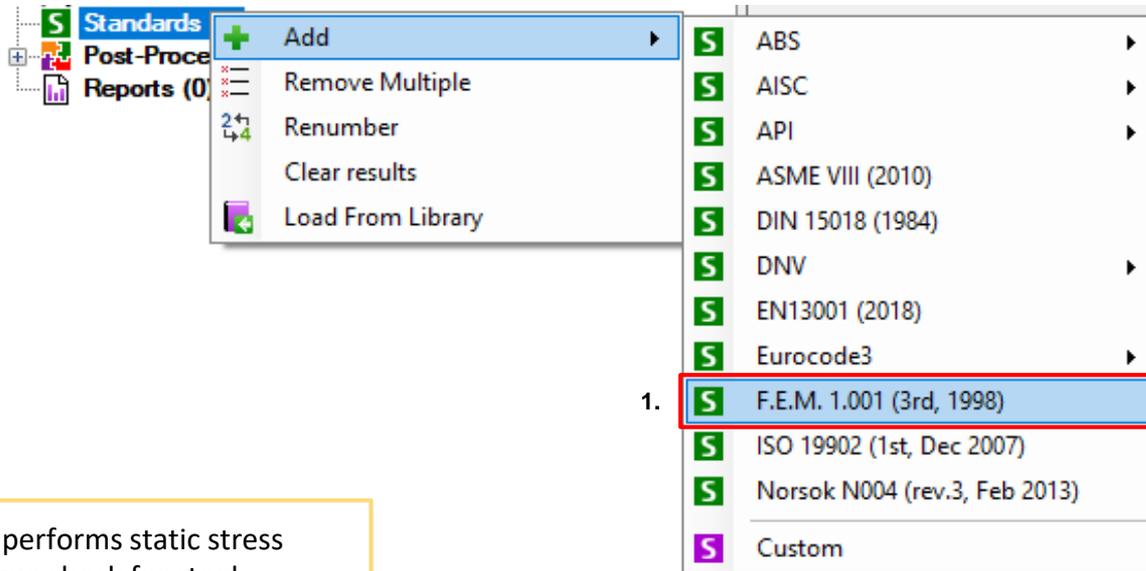

$\sigma_{tt}, \sigma_{nn}, \tau_{nt}$ – transformed x, y and shear stress in weld x, y and shear directions

θ – angle between the element and weld x directions.

Add FEM 1.001 standard

1

Execute *Add* => **F.E.M. 1.001** in Standards context menu.

F.E.M. 1.001 - performs static stress check and fatigue check for steel structures of crane and crane equipment. Fatigue calculations are performed according to Allowable Stress Design method (ASD).

F.E.M. 1.001 Standard

1 Selection: **All Entities**

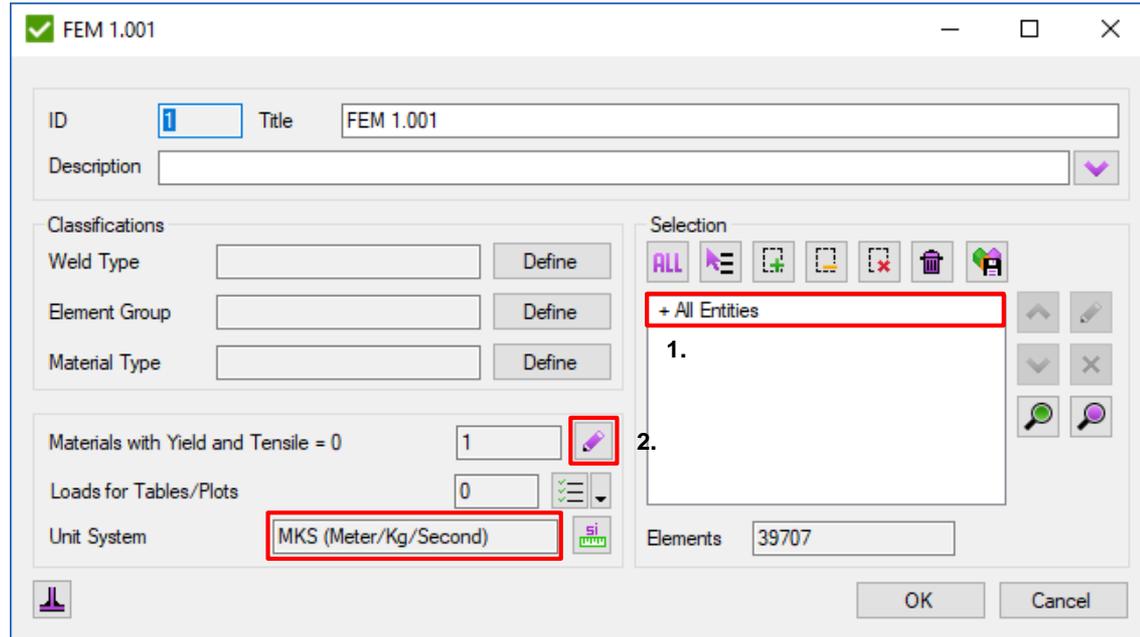

2 Press  to edit material properties.

Amount of materials with not defined Tensile or Yield is displayed in the field

3 Tensile Strength: **360e6**
Yield Stress: **240e6** and Press *Set*.

4 Press *OK*.

Unit System. Stress Fatigue values are constant for specified material and are measured in Pa. Changing unit system enables to convert Pa into Mpa, for example.

- ▶ Weld/notch category determines fatigue resistance
- ▶ Division in welds / non welds for FEM 1.001:
 - ▶ W category is for non welded parts
 - ▶ K category is for welded parts
- ▶ Fatigue resistance is further specified by adding classes
 - ▶ W0-W2 for non-welded parts
 - ▶ K0-K4 for welded parts
- ▶ Better fatigue resistance results in lower class number

Weld Classes depends on Weld Type

Non-weld group W0

nr.	description of the main types	symbol
W01	Part without hole and without joint, with a normal state of the surface, without notch behaviour.	—

Slight notch behavior group K0

nr.	description of the main types	symbol
011	Parts, joined by a butt weld of special quality, perpendicular to the direction of force.	 P 100  P 100

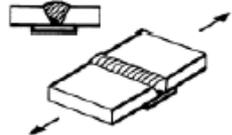

Moderate notch behavior group K1

nr.	description of the main types	symbol

Material Type classification

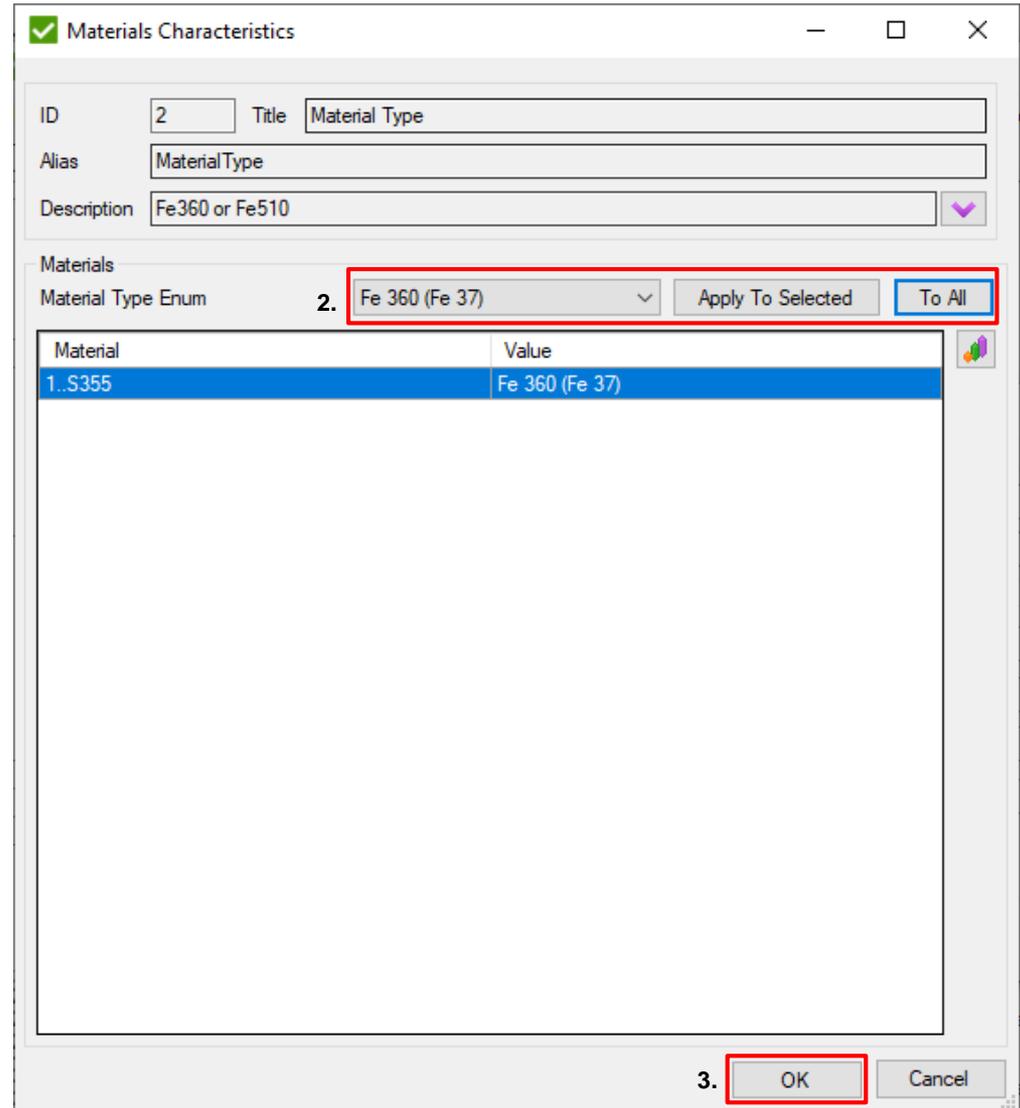

1 Press  for the Material Type.

2 Select Material Type: **Fe360 (Fe 37)**.
Press *To All*.

3 Press *OK*.

4 Press *OK* to create Standard.

Material Type defines which steel is used: St37 or St52. Stress Fatigue values are different for different materials.

The dialog box 'Materials Characteristics' is shown. It has a title bar with a green checkmark icon and standard window controls. The fields are: ID (2), Title (Material Type), Alias (Material Type), and Description (Fe360 or Fe510). Under the 'Materials' section, 'Material Type Enum' is set to 'Fe 360 (Fe 37)' with a dropdown arrow. To its right are 'Apply To Selected' and 'To All' buttons. Below this is a table with two columns: 'Material' and 'Value'. The first row is highlighted in blue and contains '1..S355' and 'Fe 360 (Fe 37)'. At the bottom right, there are 'OK' and 'Cancel' buttons.

Material	Value
1..S355	Fe 360 (Fe 37)

Create extreme table

1 Execute  *Table (expand/extreme)* in **Fatigue Check** context menu.

2 Load: **1..Load Group1.**

Fatigue check supports only Load Groups. If only one load group exist in the project it will be selected automatically.

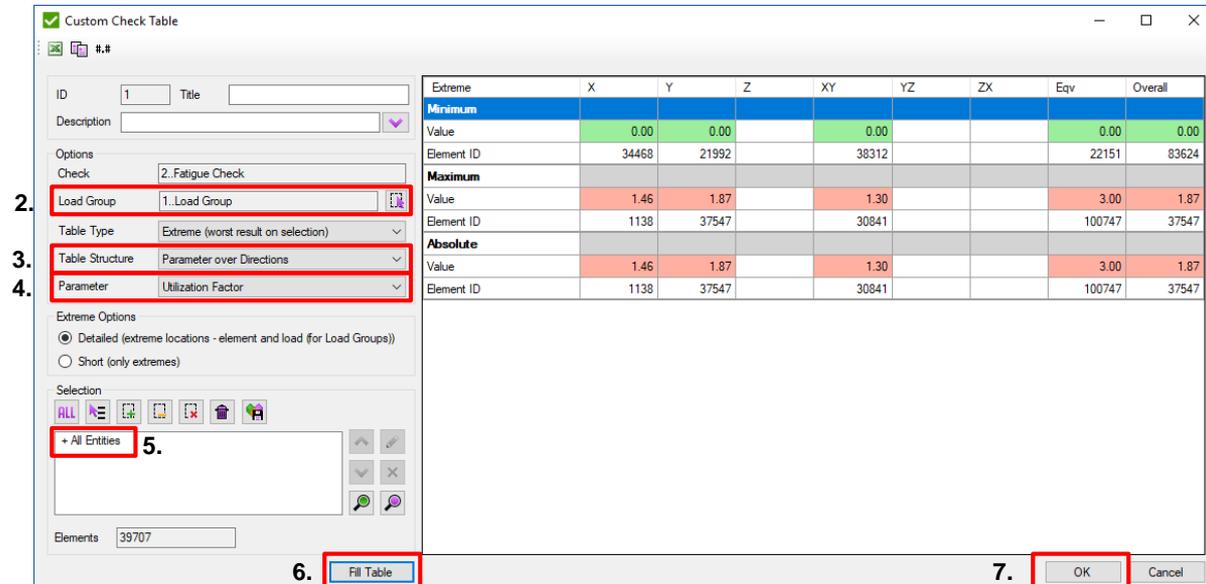

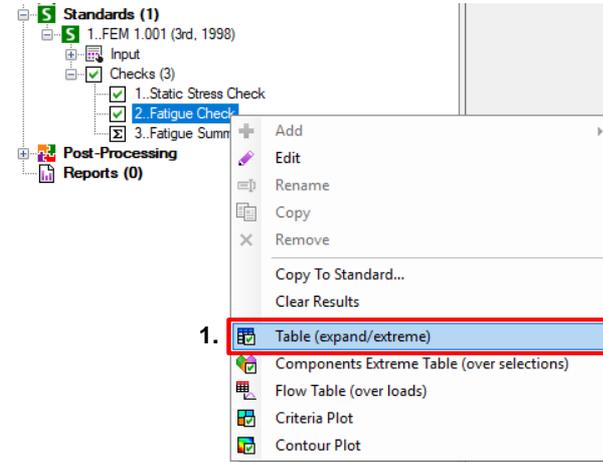

3 Table Type: **Parameter over Directions.**

4 Parameter: **Utilization Factor.**

5 Selection: **All Entities.**

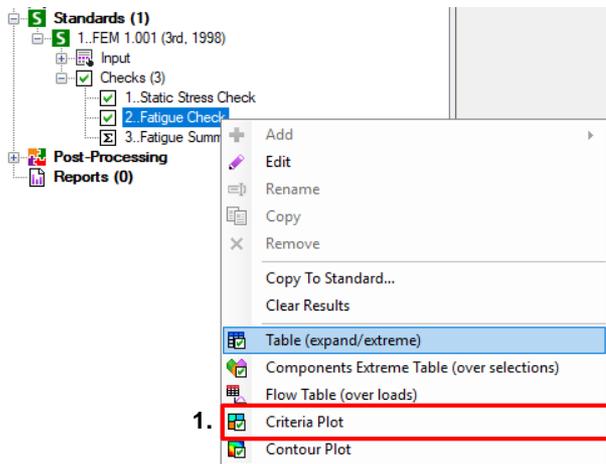

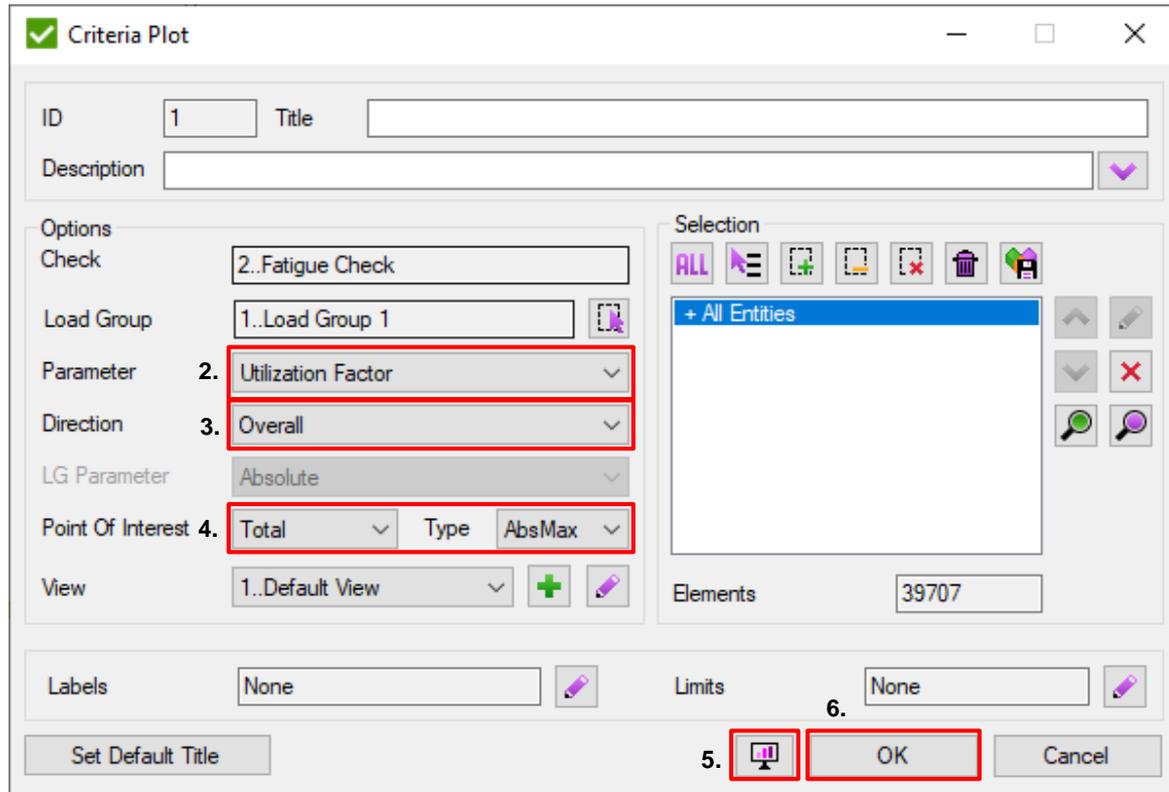

6 Press *Fill Table.*

7 Press *OK.*

Create criteria plot

- 1 Execute  *Criteria Plot* in **Fatigue Check** context menu.
- 2 Parameter: **Utilization Factor**
- 3 Direction: **Overall**
- 4 Point of interest: **Total** Type: **AbsMax**
- 5 Press  *Preview*
- 6 Press OK

Point of interest = AbsMax Total is absolute maximum utilization factors among all point of interest.

Report. Tables and plots

1 Execute *Reports* => *Add Report Designer* => *Results*.

2 Click on *Expand/Extreme Tables* in **Fatigue Check** context menu.

3 Table Type: **Extreme**.

4 Load Group: **1..Load Group**

5 Selection: **All Entities**.

6 Parameter: **Utilization Factor**.

7 Press **OK**.

The screenshot illustrates the steps to generate a report table in SDC Verifier. The 'Reports' menu is open, and 'Designer - Results' is selected. The 'Fatigue Check' context menu is open, and 'Table (expand/extreme)' is selected. The 'Custom Check Table' dialog box is open, showing 'Table Type' set to 'Extreme (worst result on selection)', 'Load Group' set to 'LG1..Load Group 1', and 'Utilization Factor' selected in the 'Parameters' list. The 'OK' button is highlighted.

Report. Tables and plots

1 Click on *Criteria Check Plot* in **Fatigue Check** context menu.

2 Parameter: **Utilization Factor**.

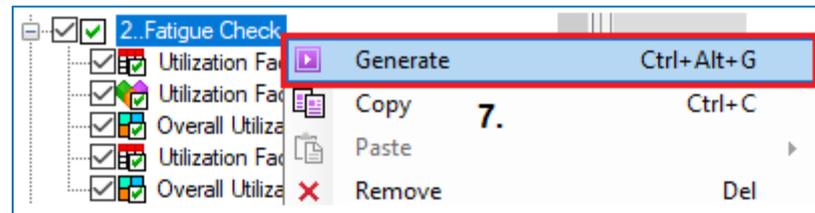

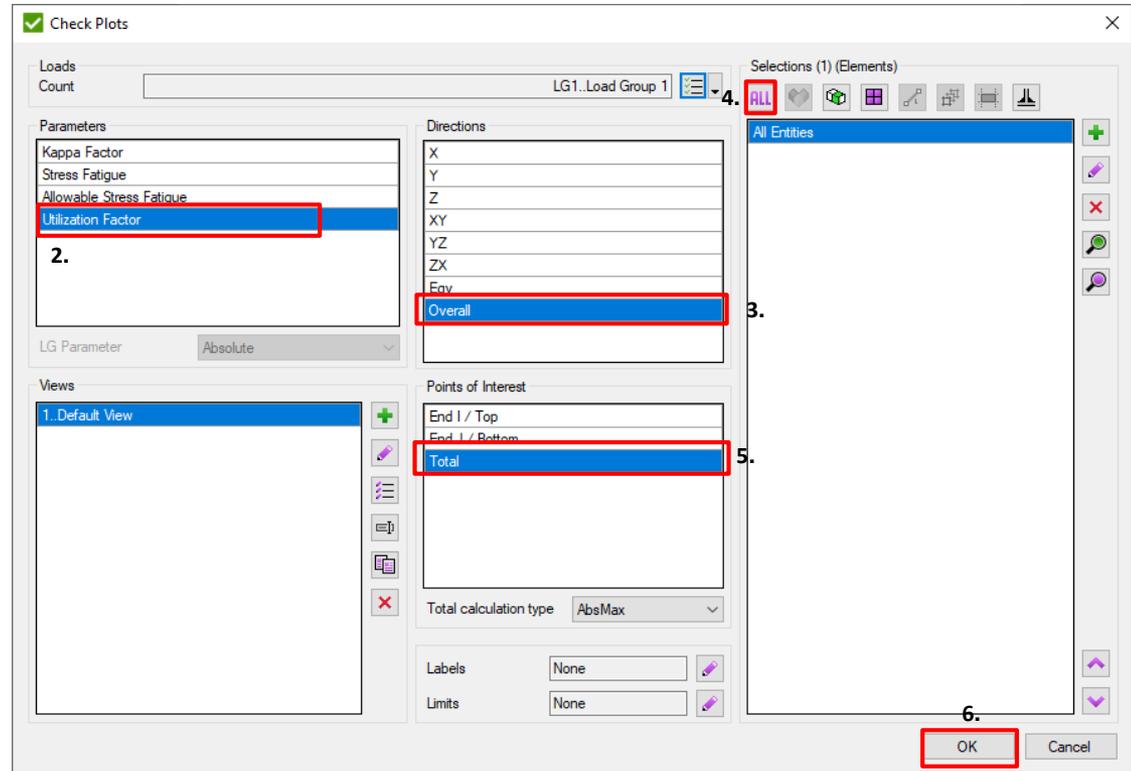

3 Direction: **Overall**

4 Point of Interest: **Total**.

5 Selection: **All Entities**.

6 Press *OK*.

7 *Generate*  check item

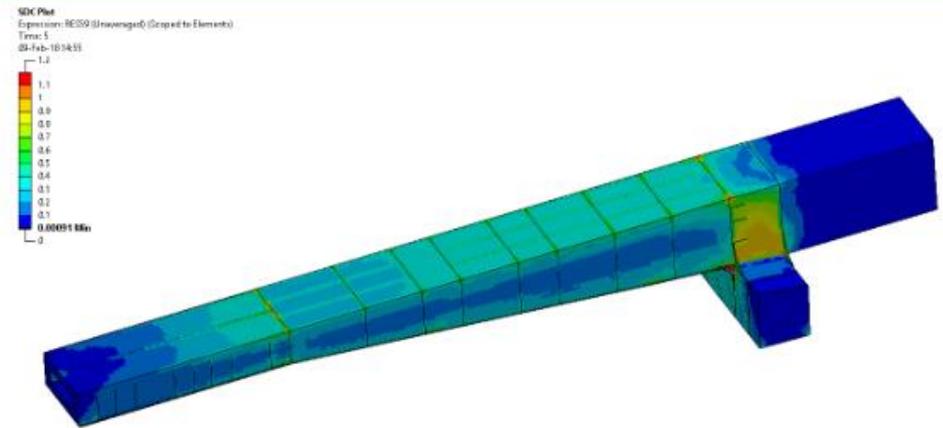

Report. Results

2..Fatigue Check

Property	Value
Category	Elemental Custom Check
Selection	All Entities
Parameters	4
Alias (Parameter)	Kappa (Kappa Factor)
Description	Ratio between the extreme stresses
All	if(SweldAbs > 0, SweldMin / SweldMax, SweldMax / SweldMin)
Alias (Parameter)	Sf (Stress Fatigue)
Description	Permissible stress for fatigue depends on the element group (E1-E8) and weld type
All	Min(units.FromPaToCurrent(Switch(MaterialType, Fe360, Sf_Fe360(ElementGroup, WeldType), Fe510, Sf_Fe510(ElementGroup, WeldType))), 0.75 * Tensile)
Alias (Parameter)	Sallow_fatigue (Allowable Stress Fatigue)
Description	Appendix 3.6, formulas (1)-(4)
All	if(Kappa > 0, if(SweldAbs > 0, 1, 1.2) * (5 / 3 * Sf) / (1 - (1 - (5 / 3 * Sf) / (0.75 * tensile)) * Kappa), if(SweldAbs > 0, (5 * Sf) / (3 - 2 * Kappa), (2 * Sf) / (1 - Kappa)))
Eqv	0
Alias (Parameter)	Uf (Utilization Factor)
Description	Appendix 3.6, equivalent rule - (5)
All	Abs(SweldAbs) / Sallow_Fatigue
XY/YZ/ZX	Abs(SweldAbs) / (Sallow_Fatigue / if(WeldType <= Weld_K4, SQRT(2), SQRT(3)))
Eqv	$\text{pow}(me.x, 2) + \text{pow}(me.y, 2) + \text{pow}(me.z, 2) + \text{pow}(me.xy, 2) + \text{pow}(me.yz, 2) + \text{pow}(me.zx, 2) - \text{sign}(\text{SweldAbs}.X) * me.x * \text{sign}(\text{SweldAbs}.Y) * me.y - \text{sign}(\text{SweldAbs}.Y) * me.y * \text{sign}(\text{SweldAbs}.Z) * me.z - \text{sign}(\text{SweldAbs}.Z) * me.z * \text{sign}(\text{SweldAbs}.X) * me.x$
Overall	$\text{Max}(me.x, me.y, me.z, me.xy, me.yz, me.zx, \text{sqrt}(me.eqv))$

Utilization Factor (LG1, All Entities)								
Standard	1..FEM 1.001			Check	[S1] 2..Fatigue Check			
Load Group	LG1..Load Group			Parameter	Utilization Factor			
Selection	All Entities							
Extreme	X	Y	Z	XY	YZ	ZX	Eqv	Overall
Minimum								
Value	0.00	0.00		0.00			0.00	0.00

Element ID	1138	37547		30841			100747	37547

Overall Utilization Factor (LG1, All Entities, v1, Total)

Check	[S1] 2..Fatigue Check	Point	Total
Load Group	LG1..Load Group	Parameter	Overall Utilization Factor
Selection	All Entities	View	1..Default View

- ▶ A better fatigue damage can be made if load cycles are specified more accurately.
- ▶ Instead of 2 million load cycles from start to end:

Load cycle	Number of cycles	Content
L4-L1	0,5 e6	LS4, LS3, LS2, LS1, IL1
L4-L2	1,0 e6	LS4, LS3, LS2, IL1
L4-L3	0,5 e6	LS4, LS3, IL1

NB gravity load is also included because the stress variation determines the fatigue damage

Add Fatigue Group (stress history) SDC VERIFIER

1 Select **Fatigue Groups** in Navigation tree

2 Title: **Detailed load cycles pattern**

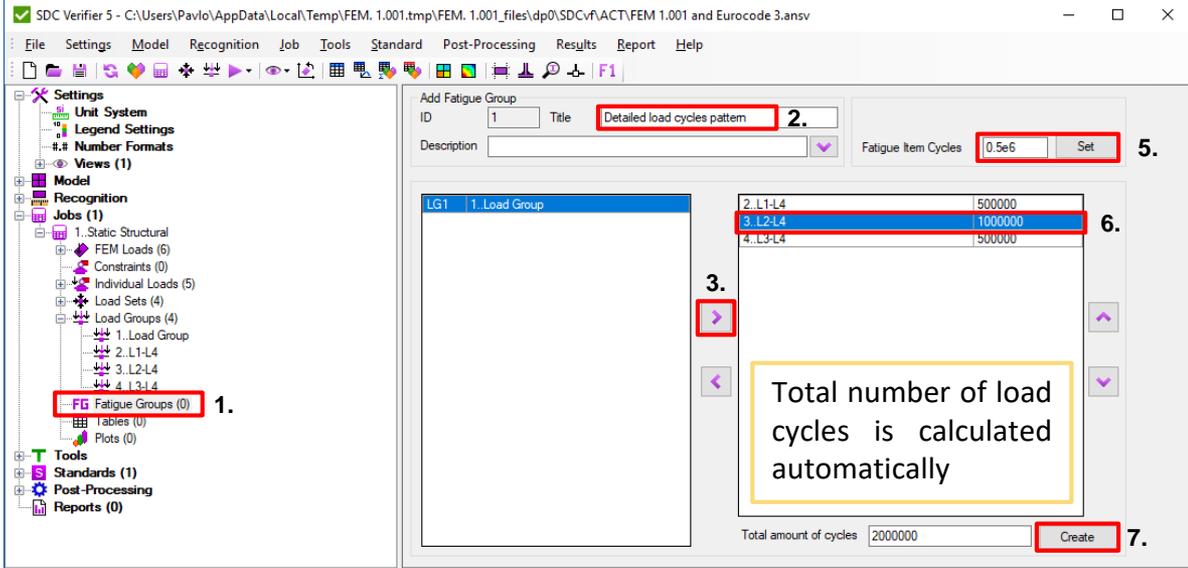

3 Select all groups and press 

4 Select **1..L1-L4** and **3..L2-L4**

5 Fatigue Item Cycles: **0.5e+6** and **Set**.

6 Set **1e+6** cycles for 2..L3-L4

7 Press **Create**

The screenshot shows the SDC Verifier 5 interface. The 'Add Fatigue Group' dialog is open, with the following settings:

- ID: 1
- Title: Detailed load cycles pattern
- Description: (empty)
- Fatigue Item Cycles: 0.5e6

The 'Load Groups' table is as follows:

Load Group	Cycles
2..L1-L4	500000
3..L2-L4	1000000
4..L3-L4	1500000

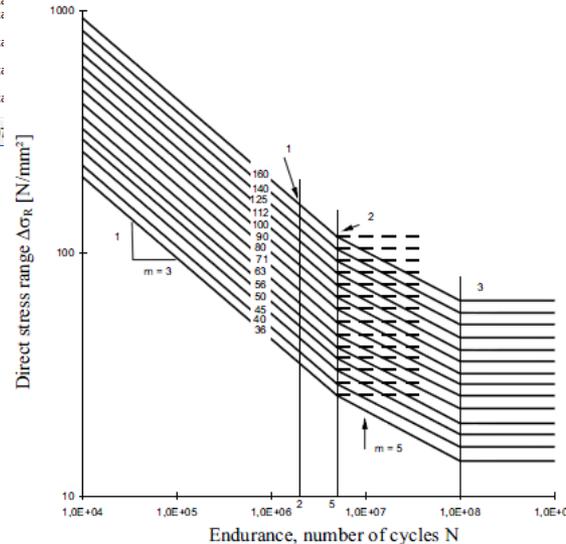

The 'Total amount of cycles' is set to 2000000. The 'Create' button is highlighted.

- 3 Cut-off limit $\Delta\sigma_L$

Fatigue calculation with Eurocode 3

- 1 Execute *Add* => **Eurocode 3 Fatigue (EN 1993-1-9)** in Standards context menu.
- 2 Consequence of Failure: **Low**
- 3 Assessment Method: **Damage tolerant**

Safety Factor	Low consequence	High consequence
Damage tolerant	1.0	1.15
Safe life	1.15	1.35

	Perpendicular to weld	Parallel with weld	Shear
Weld	80 	100 	80 
No weld	160 		100 

Table 8.1: Plain members and mechanically fastened joints

Detail category	Constructional detail	Description	Requirements
160	<p>NOTE The fatigue strength curve associated with category 160 is the highest. No detail can reach a better fatigue strength at any number of cycles.</p> 	<p><u>Rolled and extruded products:</u></p> <ol style="list-style-type: none"> 1) Plates and flats; 2) Rolled sections; 3) Seamless hollow sections, either rectangular or circular. 	<p><u>Details 1) to 3):</u></p> <p>Sharp edges, surface and rolling flaws to be improved by grinding until removed and smooth transition achieved.</p>
100		<p>7) Repaired automatic or manual fillet or butt welds for categories 1) to 6).</p>	<p>7) Improvement by grinding performed by specialist to remove all visible signs and adequate verification can restore the original category.</p>

For determination of FAT classes check standard!
In this tutorial only examples are given

Eurocode3 Fat Class

1 Press *Define* for the FAT Class.

2 Full Model: **160**

3 All Entities: **100** (No weld)

4 For welds: X: **100**; Y/XY: **80**

5 For welds intersections: X: **80**
